Chapter 11: Metal Alloys Applications and Processing

ISSUES TO ADDRESS...

- How are metal alloys classified and how are they used?
- What are some of the common fabrication techniques?
- How do properties vary throughout a piece of material that has been quenched, for example?
- How can properties be modified by post heat treatment?

Taxonomy of Metals

Steels

Refinement of Steel from Ore

Ferrous Alloys

```
Iron containing – Steels - cast irons
```

```
Nomenclature AISI & SAE

10xx Plain Carbon Steels

11xx Plain Carbon Steels (resulfurized for machinability)

15xx Mn (10 ~ 20%)

40xx Mo (0.20 ~ 0.30%)

43xx Ni (1.65 - 2.00%), Cr (0.4 - 0.90%), Mo (0.2 - 0.3%)

44xx Mo (0.5%)
```

where xx is wt% C x 100 example: 1060 steel – plain carbon steel with 0.60 wt% C

Stainless Steel -- >11% Cr

Cast Iron

- Ferrous alloys with > 2.1 wt% C
 more commonly 3 4.5 wt%C
- low melting (also brittle) so easiest to cast
- Cementite decomposes to ferrite + graphite $Fe_3C \rightarrow 3 Fe(\alpha) + C$ (graphite)
 - generally a slow process

Fe-C True Equilibrium Diagram

Graphite formation promoted by

- Si > 1 wt%
- slow cooling

Adapted from Fig. 11.2, *Callister 7e.* (Fig. 11.2 adapted from *Binary Alloy Phase Diagrams*, 2nd ed., Vol. 1, T.B. Massalski (Ed.in-Chief), ASM International, Materials Park, OH, 1990.)

Chapter 11 - 7

Types of Cast Iron

Gray iron

- graphite flakes
- weak & brittle under tension
- stronger under compression
- excellent vibrational dampening
- wear resistant

Ductile iron

- add Mg or Ce
- graphite in nodules not flakes
- matrix often pearlite better ductility

Adapted from Fig. 11.3(a) & (b), Callister 7e.

Types of Cast Iron

White iron

- <1wt% Si so harder but brittle
- more cementite

Malleable iron

- heat treat at 800-900°C
- graphite in rosettes
- more ductile

Adapted from Fig. 11.3(c) & (d), Callister 7e.

Production of Cast Iron

Limitations of Ferrous Alloys

- 1) Relatively high density
- 2) Relatively low conductivity
- 3) Poor corrosion resistance

Nonferrous Alloys

Based on discussion and data provided in Section 11.3, Callister 7e.

Metal Fabrication

- How do we fabricate metals?
 - Blacksmith hammer (forged)
 - Molding cast
- Forming Operations
 - Rough stock formed to final shape

Hot working

- VS.
- T high enough for recrystallization
- Larger deformations

Cold working

- well below T_m
- work hardening
- smaller deformations

- Casting- mold is filled with metal
 - metal melted in furnace, perhaps alloying elements added. Then cast in a mold
 - most common, cheapest method
 - gives good production of shapes
 - weaker products, internal defects
 - good option for brittle materials

Metal Fabrication Methods - II

CASTING

FORMING

Sand Casting

(large parts, e.g., auto engine blocks)

• trying to hold something that is hot

JOINING

- what will withstand >1600°C?
- cheap easy to mold => sand!!!
- pack sand around form (pattern) of desired shape

Metal Fabrication Methods - II

CASTING

FORMING

Sand Casting

(large parts, e.g., auto engine blocks)

Investment Casting

prototype

(low volume, complex shapes e.g., jewelry, turbine blades) plaster die formed around wax wax

Investment Casting

• pattern is made from paraffin.

JOINING

- mold made by encasing in plaster of paris
- melt the wax & the hollow mold is left
- pour in metal

Metal Fabrication Methods - II FORMING CASTING JOINING Sand Casting Die Casting (large parts, e.g., (high volume, low T alloys) auto engine blocks) Sand Sand molten metal Continuous Casting Investment Casting (simple slab shapes) (low volume, complex shapes -molten e.g., jewelry, turbine blades) plaster solidified die formed around wax wax prototype

Chapter 11 - 19

Thermal Processing of Metals

Annealing: Heat to T_{anneal} , then cool slowly.

Heat Treatments

Hardenability--Steels

- Ability to form martensite
- Jominy end quench test to measure hardenability.

• Hardness versus distance from the quenched end.

Why Hardness Changes W/Position

• The cooling rate varies with position.

Hardenability vs Alloy Composition

 Jominy end quench results, C = 0.4 wt% C

> Adapted from Fig. 11.14, *Callister 7e*. (Fig. 11.14 adapted from figure furnished courtesy Republic Steel Corporation.)

- "Alloy Steels"

 (4140, 4340, 5140, 8640)
 --contain Ni, Cr, Mo
 (0.2 to 2wt%)
 --these elements shift
 - the "nose".
 - --martensite is easier to form.

Quenching Medium & Geometry

• Effect of quenching medium:

Medium	Severity of Quench	Hardness
air	low	low
oil	moderate	moderate
water	high	high

- Effect of geometry: When surface-to-volume ratio increases: --cooling rate increases
 - --hardness increases

Precipitation Hardening

- Particles impede dislocations.
- Ex: AI-Cu system
- Procedure:
 - --Pt A: solution heat treat (get α solid solution)
 - --Pt B: quench to room temp.
 - --Pt C: reheat to nucleate small θ crystals within α crystals.
- Other precipitation systems:

• Cu-Be

Cu-Sn

Mg-Al

Adapted from Fig. 11.22, Callister 7e.

Chapter 11 -

Precipitate Effect on TS, %EL

- 2014 Al Alloy:
- *TS* peaks with precipitation time.

• %*EL* reaches minimum with precipitation time.

Adapted from Fig. 11.27 (a) and (b), *Callister 7e.* (Fig. 11.27 adapted from *Metals Handbook: Properties and Selection: Nonferrous Alloys and Pure Metals*, Vol. 2, 9th ed., H. Baker (Managing Chapter 11 - Ed.), American Society for Metals, 1979. p. 41.)

Alloys

- substitutional alloys
 - can be ordered or disordered
 - disordered solid solution
 - ordered periodic substitution

example: CuAu FCC

- Interstitial alloys (compounds)
 - one metal much larger than the other
 - smaller metal goes in ordered way into interstitial "holes" in the structure of larger metal
 - Ex: Cementite Fe₃C

 Consider FCC structure --- what types of holes are there?

Octahedron - octahedral site = O_H

Tetrahedron - tetrahedral site = T_D

- Interstitials such as H, N, B, C
- FCC has 4 atoms per unit cell

 $4 O_H$ sites 8 T_D sites

Summary

- Steels: increase TS, Hardness (and cost) by adding
 --C (low alloy steels)
 - --Cr, V, Ni, Mo, W (high alloy steels)
 - --ductility usually decreases w/additions.
- Non-ferrous:
 - --Cu, AI, Ti, Mg, Refractory, and noble metals.
- Fabrication techniques:
 - --forming, casting, joining.
- Hardenability
 - --increases with alloy content.
- Precipitation hardening
 - --effective means to increase strength in
 - Al, Cu, and Mg alloys.
